

Introducing eZ Publish Platform 5.4

The latest release of generation 5.x, eZ Publish Platform 5.4, is designed with an emphasis on quality and reliability, while continuing to provide you with the performance you have come to expect. eZ Publish Platform 5.4 will be our best supported and most stable release to date. The release will feature long-term extended support through late 2019.

If you are new to eZ Publish, eZ Publish Platform is a commercial open source Enterprise software solution. At its core, the content management system and the content repository. It is the foundation for you to build and run efficient content-driven applications.

“Where Content Means Business”

Content Management

The core of the platform, a content management system (CMS) offering unequaled capabilities to create, deliver and optimize content.

Digital Marketing

The platform to run efficient digital marketing supported by personalization, live analytics and marketing automation.

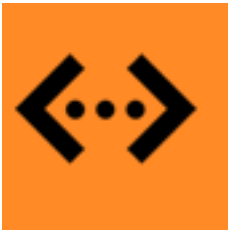

e-Commerce

The platform allows the building and integration of powerful e-business and e-commerce solutions.

New in 5.4

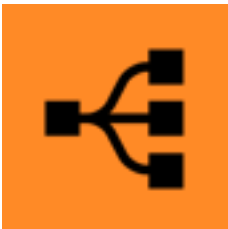

New Symfony-based image and file management

The I/O system as well as the image alias system have been ported to the new architecture, removing one of the key core dependencies to the legacy system.

Benefits

- Possible to manage your images and files on cloud-based storage like AWS
- Native clustering capability without dependency on Legacy stack
- Improved performance with possibility to deploy image and media on high performance web servers

Improved Symfony-based Cache System

The context-aware Http cache system introduced with 5.2 just got better. We've introduced powerful cache management capabilities, native out of the box Varnish support, and better Symfony and eZ Publish integration.

Benefits

- Simplified deployment of high performance setups
- Better support for multichannel and multi-location content cache
- Simplified administration and maintenance
- Standardized approach

Premium content access wall

The demo-bundle features a new premium content wall. For use cases such as paid-content, this feature delivers full content to subscribers and only delivers a teaser to non-subscriber. A best practice that still needed to be available out of the box.

Benefits

- Simplifies deployment of complex permission-based access to your content
- Enables promotion of subscription based paid access to content

And also

Many other improvements such as dynamic settings for site accesses management, improved Search API performance, new field types and Twig helpers, URL decorators, integration of breadcrumb and menu Symfony bundles. See the 5.4 [release notes](#) for more.

Facts

5.4

- Version: eZ Publish Platform 5.4
- Support: November 2017 with extended support available up to November 2019
- Last of the 5.x generation
- Simple upgrade path from 5.3 to 5.4
- Simple upgrade path from 5.4 to the next eZ Platform

Optional Customer Experience Services

Personalization with eZ Recommendation

The eZ Recommendation Service creates a unique and dynamic experience each time a user visits your website. It turns each visit or shopping experience into a tailored and targeted moment as news, images, videos, products and events are recommended in real-time according to your users' individual consumption, interests and behavior.

Marketing Automation

eZ Marketing Automation makes it easy to automate all kinds of marketing tasks. Get more done in less time while nurturing your prospects, uncovering qualified leads and driving revenue growth.

eZ Live Viewer real-time analytics

eZ Live Viewer lets you keep track of how your website's content performs in real-time by sending alerts and recommending changes that improve content performance. Users are provided with a visual overview of audience interaction that's simple to evaluate. No technical knowledge required!
